

1. (30 points) The following problems are not related.

(a)

- i. the maximum error for the area of the square;
  - ii. the relative error for the area of the square.
- (b) (12 points) You are flying a kite which has a constant height of 4 meters above the ground. The wind is carrying the kite horizontally away from you, and you have to let out string at a rate of 2 meters/minute. What is the horizontal speed of the kite when you have let out 5 meters of string?

**Solution:**

- (a) i. The area of a square is given by  $A(h) = h^2$ , so we have that

$$dA = 2hdh = (2)(3)(0.1) = 0.6:$$

Hence, the maximum error for the area of the square is  $0.6 \text{ cm}^2$  in this situation.

- ii. For a side length measurement of 3 cm, the area is  $9 \text{ cm}^2$ , so the relative error for the area is

$$\frac{dA}{A} = \frac{0.6}{9} = \frac{3}{5} \cdot \frac{1}{9} = \frac{1}{15} \quad 6.\overline{66}\%:$$

- (b) Letting  $z$  be the hypotenuse (the distance from you to the kite), and  $x$  the horizontal distance, we know that

$$z^2 = x^2 + 4^2 \Rightarrow 2z \frac{dz}{dt} = 2x \frac{dx}{dt} \Rightarrow \frac{dx}{dt} = \frac{z}{x} \frac{dz}{dt}:$$

In order to get a value for  $\frac{dx}{dt}$ , we first need to get the value of  $x$  when  $z = 5$ :

$$5^2 = x^2 + 4^2 \Rightarrow 25 = x^2 + 16 \Rightarrow 9 = x^2 \Rightarrow x = 3:$$

Hence, when  $z = 5$ , we have that

$$\frac{dx}{dt} = \frac{z}{x} \frac{dz}{dt} = \frac{5}{3} (2) = \frac{10}{3} \text{ meters=min.}$$

3. (16 points) Consider the function  $s(x) = x^3 + 3x + 2$ .

- (a) Find the critical numbers of  $s(x)$ .
- (b) Use the first derivative test to determine the points where  $s(x)$  has a local maximum or local minimum. *Give your answer as ordered pairs  $(x; y)$ .*
- (c) Find the absolute maximum and minimum values for the function  $s(x)$  on the interval  $[0; 2]$ .

**Solution:**

(a) To find the critical numbers, first take the derivative

$$s'(x) = 3x^2 + 3:$$

Since the domain of  $s'(x)$  is  $(-1; 1)$ , the only critical numbers are solutions to the equation

$$0 = 3x^2 + 3;$$

and hence

$$0 = 3x^2 + 3 \Rightarrow 3x^2 = 3 \Rightarrow x^2 = 1 \Rightarrow x = \pm 1:$$

So  $x = \pm 1$  are the only critical numbers. The function values at the critical numbers are  $s(-1) = 0$ ,  $s(1) = 4$

(b) In order to determine whether each critical number  $x = \pm 1$  is a local maximum, minimum, or neither, we apply the first derivative test to the intervals  $(-1; 1)$ ,  $($

which implies that  $x = 2$ . Hence, we have to find the tangent line at the point  $(2; 0)$ . Plugging these values into the formula for  $\frac{dy}{dx}$ , we find that

$$\frac{dy}{dx} \Big|_{(x,y)=(2,0)} = \frac{1-2 \cdot 0}{0+1} = \frac{1}{2}.$$

Then an equation for the tangent line to the curve at  $(2; 0)$  is given by

$$y = \frac{1}{2}(x - 2):$$

5. (16 points) Consider the function  $f(x) = \frac{1}{x}$  on the interval  $[2; 4]$ .

- (a) (8 points) State the Mean Value Theorem and verify that  $f(x)$  satisfies the hypotheses on the given interval.
- (b) (8 points) Find all numbers  $c$  that satisfy the conclusion of the Mean Value Theorem for  $f(x)$  on the interval  $[2; 4]$ .

**Solution:**

- (a) If  $f(x)$  is continuous on  $[a; b]$  and differentiable on  $(a; b)$ , then there is a  $c$  in the interval  $(a; b)$  such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}.$$

The only value where  $f(x)$  is discontinuous is  $x = 0$ , so  $f(x)$  is continuous on  $[2; 4]$ . The function  $f(x)$  is differentiable on  $[2; 4]$ , since  $f'(x) = -\frac{1}{x^2}$ , which is undefined only at  $x = 0$ .
